NCS Digital Atlas

The NCS Digital Atlas is a colour atlas that visualizes all the 1 950 NCS Original colours specified in CMYK and positioned in the NCS Colour Space. To make the NCS Digital Atlas, the NCS Palette Creative has been used to specify the colours. The NCS Palette Creative is a set of colour librarys which gives you access to the NCS colours in your different computer software, regardless of whether it is for your monitor, for your colour printer or for a printing press.

The NCS Digital Atlas contains the standardized 1 950 NCS Original colours and includes the 200 New Colours introduced 2004. These colours have been placed in their right positions in the NCS Colour Space to get a clear overview of the colours. 184 of the colours lie in intermediate steps in the light area, and the size of the colour samples has been adapted to fit in their positions in the NCS Colour Triangles.

To get the most out of the NCS Digital Atlas we recommend that you work with it in combination with a colour tool from NCS 1950 Original Colour Sample Collection (e.g. an NCS Atlas or an NCS Block) as well as the NCS Palette Creative.

Use the NCS Digital Atlas as a reference point and as a tool to orientate and compare the colours on the screen or the print-out with a coated NCS colour sample. Then you can see the shifting of the colours and can specify the colours on the basis of that.

The NCS Digital Atlas in combination with NCS Palette Creative is useful for all kind of digital colour selection and colour design, for architects and designers and for regular computer users. With the digital colour palettes, it is easy to select and specify the correct NCS colours in your drawing-, image processing- or layout program. You can easily change the NCS colours on different objects, e.g. scanned-in houses and environments, directly on your monitor.

Colour Differences

Depending on limitations in the printing technique, differences can arise between the printed result of the NCS Digital Atlas and the nearest NCS colour sample. For technical reasons, variations between the monitor and NCS Original colour samples can also occur. When communicating colour, always refer to the NCS notation and an NCS Original colour sample to be certain to get the best colour accuracy.

Print-outs from different computer printers often vary a lot depending on the printing technique (e.g. laser or inkjet). The colour settings in the print-driver, the operation system and the application also influence the printed colours. Therefore it is important to adjust these settings to simulate a four-colour print on matt-coated paper. The best is also to work in CMYK mode in the application to avoid unnecessary colour conversions to and from RGB. Note that the colour on the screen may look slightly different comparing to the NCS colour sample because of the conversion from CMYK into RGB.

The NCS System describes the whole colour space, but does not guarantee that all colours in the NCS Digital Atlas can be produced in all imaginable materials and qualities by all manufacturers. In doubtful cases, we recommend that you consult the manufacturer of the material of interest before the colour is ordered. For NCS products and retailers, please visit the NCS web site www.nescolour.com.

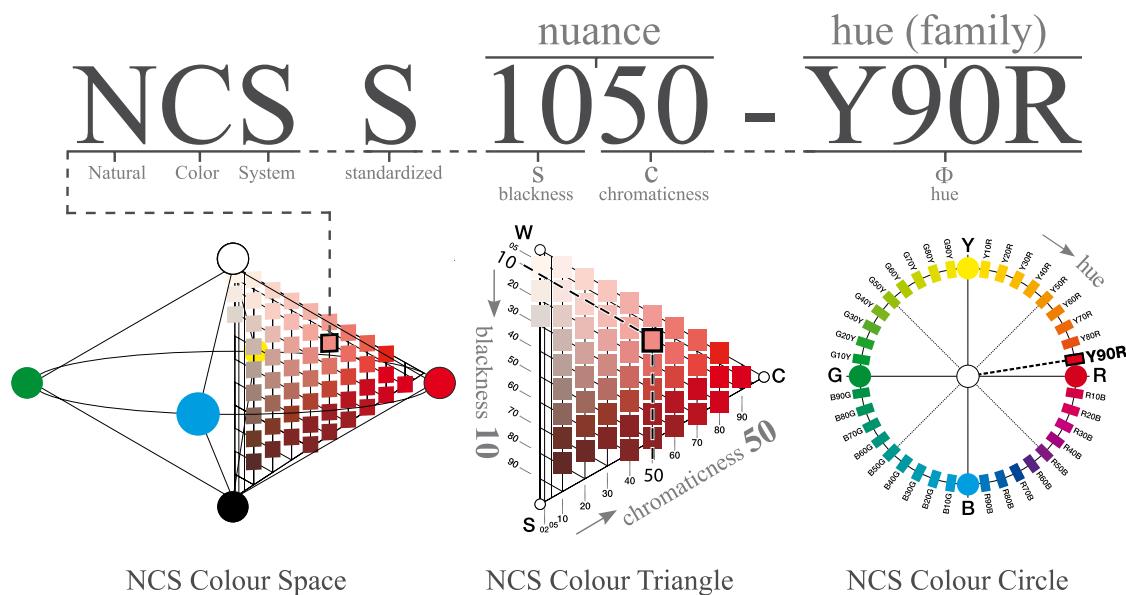

The NCS[®] System

NCS - Natural Color System[®] is a system with the help of which all possible surface colours (not fluorescent or metallic colours) can be described. That facilitates and guarantees exact colour navigation in design, communication and production. The NCS system is illustrated by an NCS Colour Atlas containing 1950 colour samples. Today, the NCS is one of the most widely used colour-describing systems in the world and has acquired international scientific acknowledgement. Besides, it is a Swedish, Norwegian, Spanish and South African national standard. NCS colour samples hold world-leading colour quality to provide exact colour match between different productions of colour samples, in order to make sure that the colour is always the same.

The letter S preceding the complete NCS notation (NCS S 1050-Y90R) means that the NCS sample is a standardized NCS colour sample issued by the Scandinavian Colour Institute, the NCS Quality Centre, and that it follows the NCS Quality Management system according to the Edition 2.

The variables in the NCS notations are built entirely on visually observable properties of the colours. In the NCS notation for the colour NCS S 1050-Y90R, the first two digits indicate the percentage of visual blackness in the colour. The next two digits indicate the colour's chromaticness, i.e. how strong the colour is. The letter-number combination after the hyphen indicates the colour's hue, i.e. which chromatic attributes are included and the relation between these. In this case, it is a yellow hue with 90% redness.

The NCS can also be illustrated graphically in a three-dimensional model, where the blackness and chromaticness are given in an equilateral triangle and the hue on a circle. A point in the triangle and a line on the circumference of the circle provide an unequivocal description of a colour. The colour NCS S 1050-Y90R is marked in the triangle and in the circle below. For more information, please visit: www.ncscolour.com.

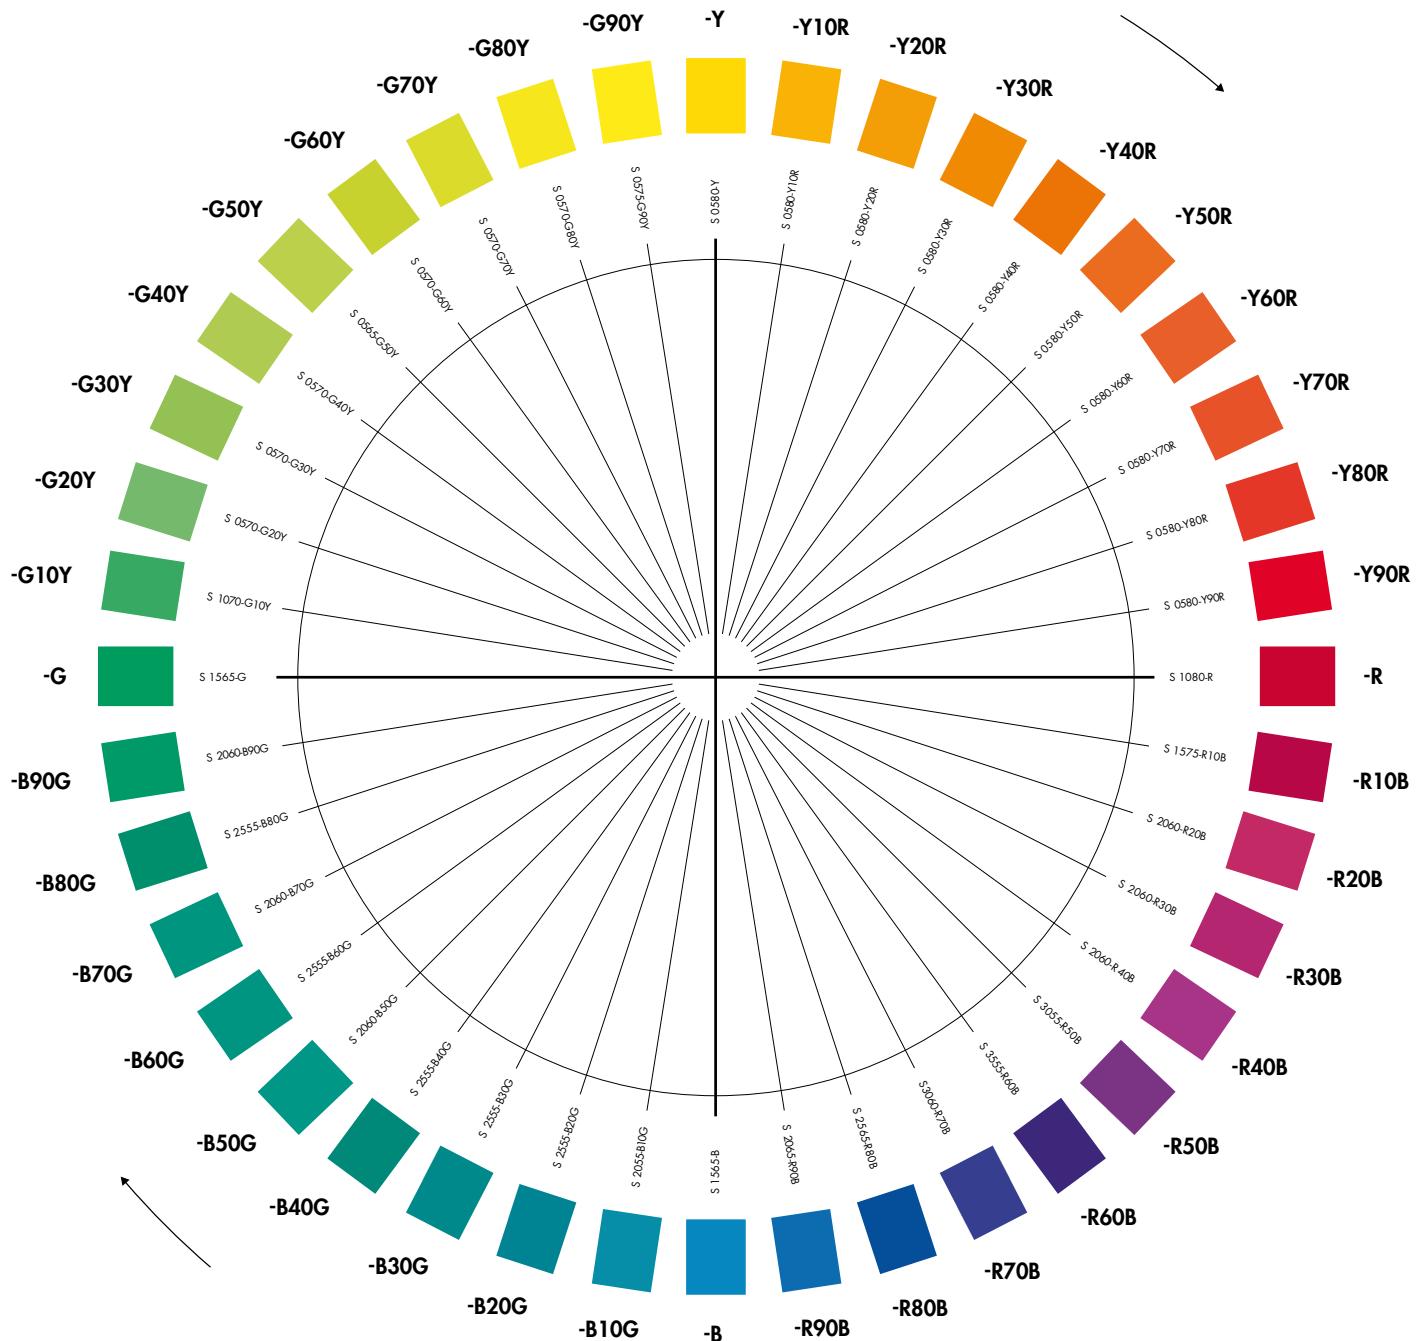

The Natural Color System[®] - the key to your colour solutions

The visual NCS colour system makes it easy to visualize, design, select, communicate, document and manufacture any colour rationally, accurately and consistently. The NCS notation has a true visual meaning and can be understood and communicated globally.

NCS has created an exceptional tool for design, marketing, sales, communication and production, integrated in one system for multiple material industries. Simply: One system - one colour - one notation - any material.

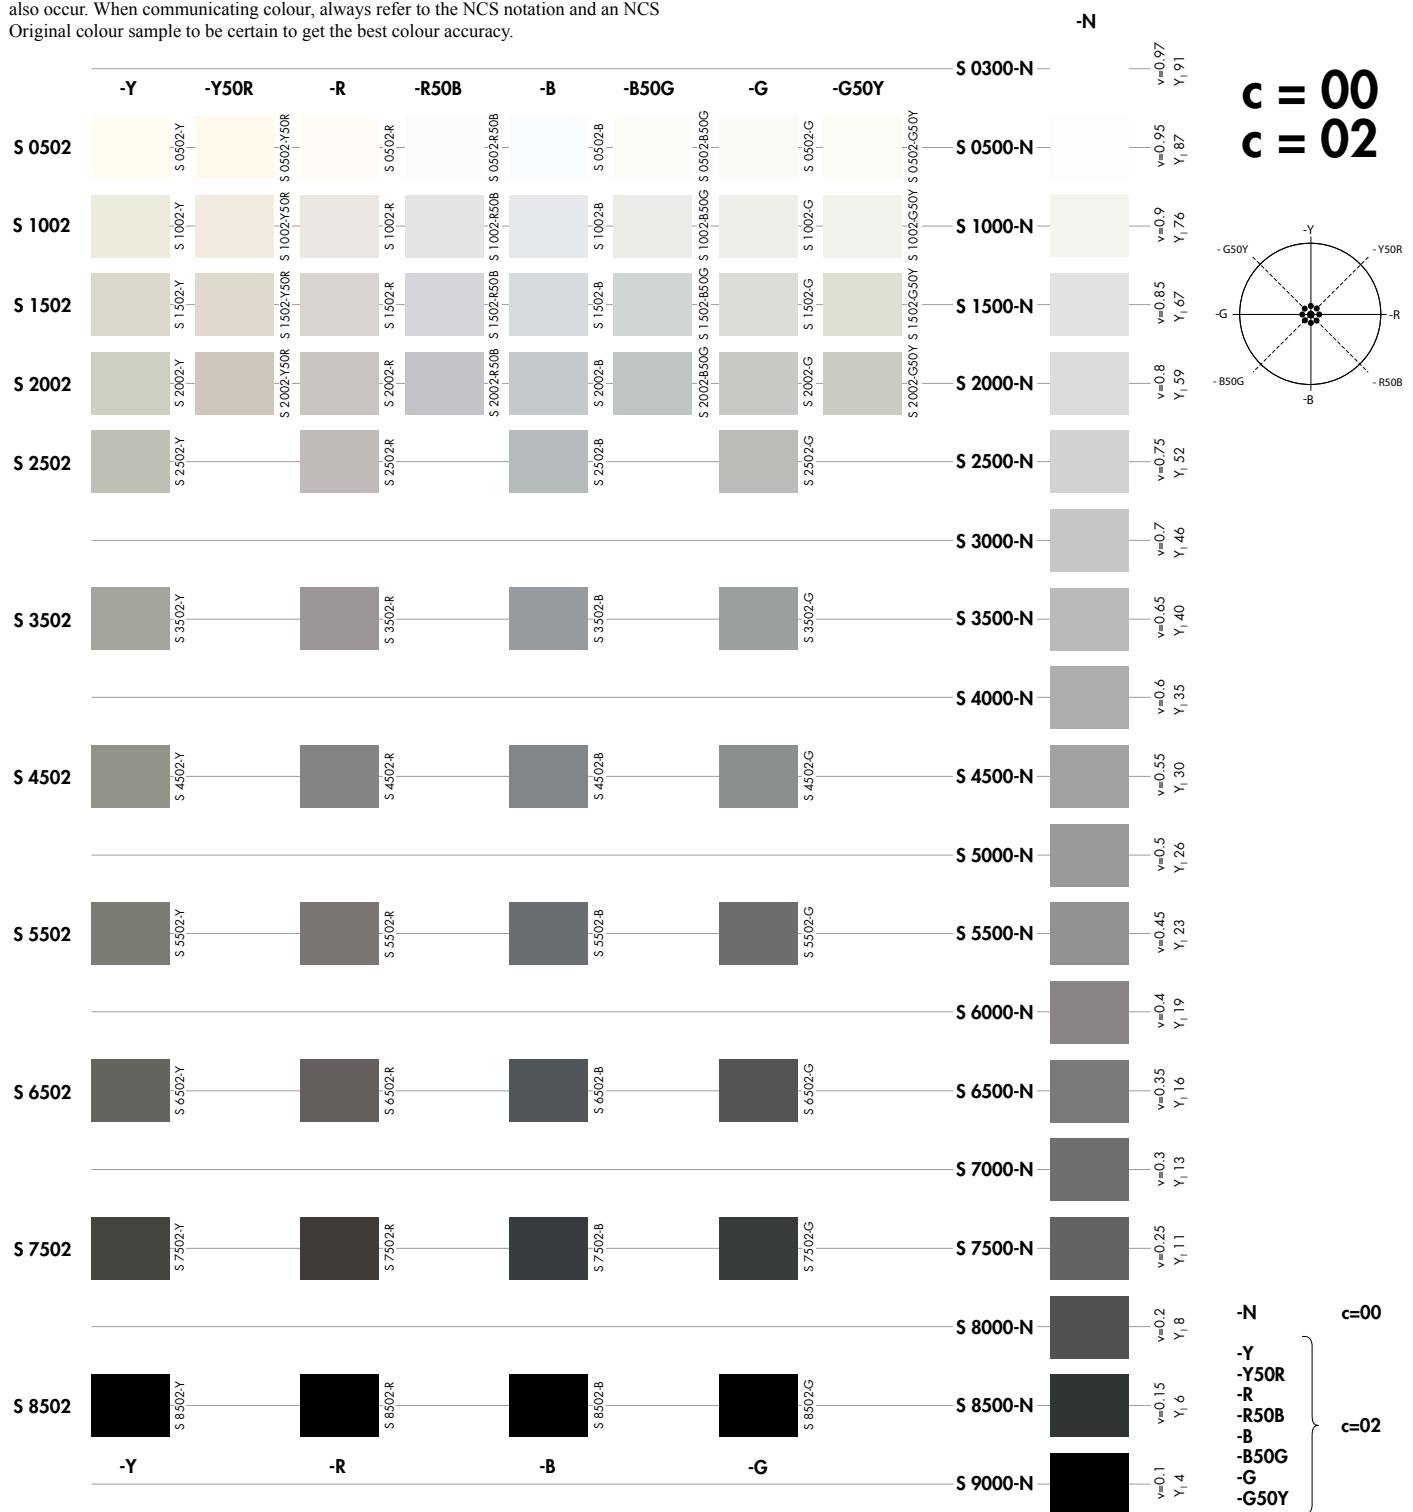

NCS DIGITAL ATLAS 1950

Depending on limitations in the printing technique, differences can arise between the printed result of the NCS Digital Atlas and the nearest NCS colour sample. For technical reasons, variations between the monitor and NCS Original colour samples can also occur. When communicating colour, always refer to the NCS notation and an NCS Original colour sample to be certain to get the best colour accuracy.

NCS – CMYK – RGB

Translation Table

For your service, we have included approximate CMYK and RGB values for all of the 1 950 NCS Original colours. The CMYK values are exactly the same as those found in the NCS Palette Creative's digital colour libraries and the NCS Digital Atlas. The CMYK values are meant for offset printing on matt-coated paper, for more information see "NCS - CMYK - RGB". This translation table can also be used to find the nearest RGB value for a specific NCS colour.

We recommend you to use CMYK values when possible, since the resulting colour on screen or in print will often deviate from the standard NCS colour sample when using RGB. The resulting colour depends on the actual screen, printer and software drivers used.

There are technical limitations of printing colours. These limitations become apparent, when the lightest and the most chromatic NCS colour samples in the orange, purple and green area are matched to CMYK values. Colours, which the four-colour printing technique does not manage to reproduce exactly, have been highlighted in grey in this table. These colours are divided into two classes. In the list, the light grey indicates colours with a legible deviation from the NCS Original colour sample. The darker grey indicates colours with an even greater deviation between expected outcome and the NCS colour sample. For colours of both classes, a representative CMYK value, which is judged to be the visually closest to the NCS Original colour sample, has been selected. For more information see "Technical Limitations of Printing".

Colour Accuracy

Ignorance about colour, lack of better solutions etc. all combine to turn the choice and control of colour into a costly venture. Many of the different Colour Sample Collections on the market are being far from consistent. Often a colour may vary a great deal from one print to the next, which leads to miscommunication and the loss in marketing value, and the cost for customer claims are enormous.

High colour accuracy is essential, if we desire a perfect colour appearance in the final product - the colour appearance our customers expect.

Research behind the NCS - Natural Color System® has led to a logical system for all of the 10 million colours we can perceive. It simplifies colour specification and makes it possible to give exact notations for any colour. Using NCS, the exact notations, the globally leading colour accuracy and colour consistency on the NCS colour samples reduce the problem of the unacceptable colour variations of the past.

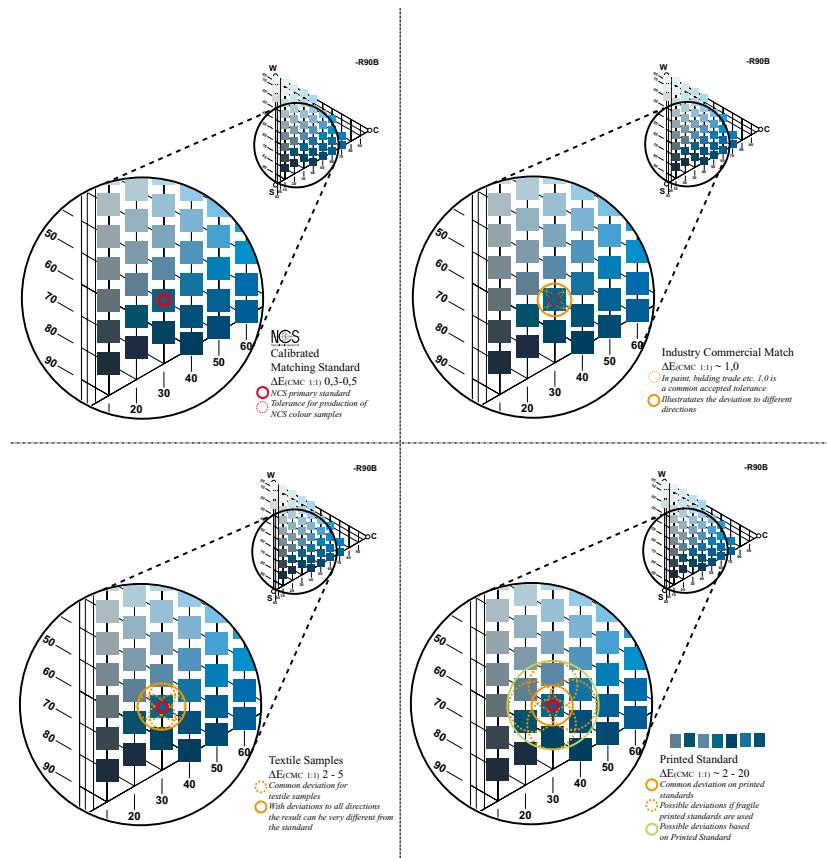

How to Recognize Quality and Colour Accuracy

The visual appearance, i.e. how the colour looks to the eye, is the most important way to judge colour. However, industry often uses measured colour values, received from a spectrophotometer, to control the colour of the standard and the match.

The instrumental values are calculated into a $\Delta E_{(CMC\ 1:1)}$ (Delta E) value. "E" is supposed to indicate the composite picture of the total colour difference (summation of the differences in lightness, chroma and hue). Ideally, the $\Delta E_{(CMC\ 1:1)}$ is a perceptual indication of the size of the visual colour difference between two colours. It is the best means of technical assessment known today.

The Delta E scale starts at 0, where $\Delta E_{(CMC\ 1:1)} = 0$ stands for no perceived difference at all. At $\Delta E_{(CMC\ 1:1)} = 0,3$ the difference starts to become visible. In most printed sample collections only 20 % of the colour samples attain $\Delta E_{(CMC\ 1:1)} = 2$, the remaining 80% is even worse, $\Delta E_{(CMC\ 1:1)} = 2-20$. NCS has managed to diminish the unacceptable colour variations of the past, reaching almost zero, $\Delta E_{(CMC\ 1:1)} = 0,3$. Thanks to the NCS Quality Management colour tolerances are steadily being reduced. Do not forget, the human eye is still the most effective way to evaluate the visual appearance of a colour.

NCS – CMYK – RGB

In the NCS Digital Atlas, the 1 950 NCS Original colours are converted into CMYK values. When using the NCS Digital Atlas you work with different colour spaces that mix the colours in different ways. This might result in different visual appearance of the colours depending on if you view them on a screen, an offset print, or comparing a regular print-out with an NCS colour sample.

RGB

On a monitor, all colours are created with mixtures of red, green and blue light (RGB). Different monitors do not use the same red, green and blue primary colours, which is one of the reasons why the same RGB values can appear as different colours depending on different screens.

CMYK

In four-colour print or in a computer printer, the colours are mixed from CMYK - cyan (blue), magenta (bluish red), yellow and black pigment. CMYK is a recipe how the colour should be mixed, and the visual appearance of the colour depends on what paper it is printed on. The primary colour for offset print usually follows the international standard. For computer printers there is no comparable standard.

NCS

The Natural Color System® (NCS®) is the only colour system that describes colours exactly as we see them, which is why the system is easy to understand, logical and simple to use. Any of the millions of colours that exist can be defined within the NCS system and given a precise notation.

The NCS Original Colour Sample Collection includes 1 950 of these colours. The NCS colour samples are made of paper coated with completely covering semi-matt varnish paint.

When the NCS system is known, it is possible to judge the attributes of a colour by its notation. The NCS notations describe the purely visual properties of the colour and have nothing at all to do with the mixing of pigments or reflection curves etc.

Technical Specifications

To get the most accurate colour match in all media, when using the NCS Palette and the NCS Digital Atlas, it is very important that the settings in the computer's operative system, software programs and print-drivers are adjusted to simulate the conditions that have been used to develop the CMYK values for the NCS 1 950 standard colours.

CMYK Values

The CMYK values for the NCS colours in the NCS Palette, and used to make the NCS Digital Atlas, are based on and visually checked against the DCS® BOOK CMYK, Digital Colour Scale, (ISBN 3-9805793-5-2). This is an extensive printed colour scale based on the latest international standard for four-colour printing. This is a widely used professional colour scale. By basing the NCS Palette on the international standards for four-colour printing, we think this gives the best condition to reach an accurate colour reproduction also on screens and computer printers.

The technical specifications for the DCS® BOOK CMYK are as follows:

Screen: 60l/cm – 150 lpi

Screen angles	Cyan (C)	15°
	Magenta (M)	75°
	Yellow (Y)	90°
	Black (K)	45°

Uncertainty of tone values on films: max ±2%

Paper: BVS white, matt-coated, wood-free, 135g/m²

Tone value increase:

40% middle tone	16% ± 3% (CMY)
	19% ± 3% for K
80% shadow tone	12% ± 2% (CMY)
	14% ± 2% for K

Solid tone coloration: in accordance with DIN ISO 12647-2

Colour sequence: black – cyan – magenta – yellow

CMYK Values for the NCS Colours

All colours in the NCS Digital Atlas are specified in terms of the percentages of yellow, magenta, cyan and black inks. CMYK values on the Palette are determined with 100% achromatic CMYK mixtures, which means that at least one of the chromatic elementary colours cyan, magenta, or yellow always is 0, as colour results in many printers will be much better that way.

In the NCS Palette Creative that have been used for the making of NCS Digital Atlas, the NCS Quality Centre has made extensive measurements of the DCS® BOOK and thereafter made individual visual controls of each colour to get the best visual colour match between the NCS colour sample and the closest CMYK value. Each and every NCS colour sample has been compared to the CMYK colours to find the best possible match.

Measurement Values

The DCS® BOOK contains about 65 000 CMYK prints. Out of these a selection of 20 000 CMYK prints have been measured and calculated by the NCS Quality Centre. The measurements have then been evaluated and matched with the 1 950 NCS standard colours.

The CMYK colours have been measured in a Macbeth ColorEye 7000 spectrophotometer. That instrument is calibrated against the NCS reference instrument, a Zeiss DMC 26 spectrophotometer. The measurement geometry is d/8, SCI. CIE values are based on the standard illuminant D65 and the 1964 standard observer. Measured differences in colour reproduction are indicated in $\Delta E_{CMC(1:1)}$ units.

Visual Control

The accuracy of the measured and calculated colour matches with NCS Original colour samples has been checked as well as tested in a Laser- and Ink Jet printer. Each and every CMYK colour has then been visually compared with an NCS colour sample.

The outcome of the test print has been modified for best visual match to secure the best possible colour accuracy, when a colour is converted from a coated NCS colour sample to a CMYK value in the NCS Palette.

In the case where the measured- and calculated value and the value from the visual control differ, the values based on the visual control have been selected. This is because the visual appearance of a colour is the most important way to judge a colour.

Technical Limitations of Printing

The NCS System is currently illustrated with 1 950 colour samples (manufactured with covering varnish paint on paper) evenly distributed over most of the colour space. In order to obtain exactly the right colour on all samples, some 25 different colour pigments are used today.

On a monitor, all colours are created with mixtures of red, green and blue light (RGB) and in four-colour print or in a printer, the colours are mixed from yellow, cyan (blue), magenta (bluish red) and black pigments or inks (CMYK). These techniques, which use only three or four different colours/pigments, can therefore only reproduce a reduced number of colours.

These limitations become apparent, when the lightest and the most chromatic NCS colour samples in the orange, purple and green area are matched to CMYK values. Colours, which the four-colour printing technique does not manage to reproduce exactly, have been highlighted in grey in the NCS Translation Table with the NCS – CMYK – RGB values. These colours are divided into two classes. In the list the light grey indicates colours with a legible deviation from the NCS Original colour sample. The darker grey indicates colours with an even greater deviation between expected outcome and the NCS colour sample. For colours of both classes, a representative CMYK value, which is judged to be the visually closest to the NCS Original colour sample, has been selected.
